BIOFUSION®

BIOFUSION®

BIOFUSION® is a scientifically traceable organic cotton, thanks to an innovative method based on forensic science.

BIOFUSION® cotton is cultivated using organic production systems and products that have a low environmental impact. To adhere to GOTS and OCS certifications, a cotton must meet the following requirements:

1. The seed must be GMO-free;
2. Natural materials must be separated from conventional fiber products throughout the production process, to ensure traceability throughout the entire chain of custody;
3. An environmental protection policy must be respected, aimed at reducing consumption, discharges and the use of chemicals to a minimum;
4. Defoliation must not be induced with synthetic chemicals, but occur naturally.

The cultivation methods of BIOFUSION® cotton fully comply with all these requirements.

REGENERATIVE BIOFUSION[®]

REGENERATIVE BIOFUSION®

REGENERATIVE BIOFUSION® is the organic and scientifically traceable cotton in accordance with the principles of regenerative agriculture.

The new challenge, however, is to ensure the **lowest possible environmental impact yet all the while regenerating land fertility.**

HOW?

Through regenerative agriculture, which aims to rationalise resources: **do better, with less.** Nourishing plants properly without impoverishing the soil but rather regenerating it, reducing emissions and the impact on biodiversity.

REGENERATIVE AGRICULTURE

Regenerative agriculture is a holistic method based on specific principles for regenerating:

- Soil;
- Ecosystems and biodiversity;
- Relations between living beings;
- Knowledge.

The agricultural practices that can be implemented to achieve these 4 objectives are many. The main ones, also applied by Bowles Farming, the American farm with which Albini developed this first project, are summarised as follows.

PAST PRACTICES

Reduced tilling of soil

Only the most superficial layer of the soil is treated, to reduce the release of CO2 and reduce the stress and impoverishment of the soil, unlike what happens with conventional cultivation plowing techniques which go deeper.

To proceed with this technique, Bowles Farming uses a specific machinery, which operates only in preparing the seedbed by mixing the first 10-15 centimeters of the soil surface.

PAST PRACTICES

Soil covering: cover crops

Cover crops offer benefits to the following crop, including: nitrogen supply, disease and insect suppression, soil moisture conservation, erosion prevention and weed suppression. Through soil coverage, agricultural land is not left uncovered, increasing biodiversity and reducing the dependence of agroecosystems on external inputs.

Plants that are complementary to cotton: peas, clover and rye grass.

PAST PRACTICES

Waste reduction, re-use of resources

Less input, greater output.

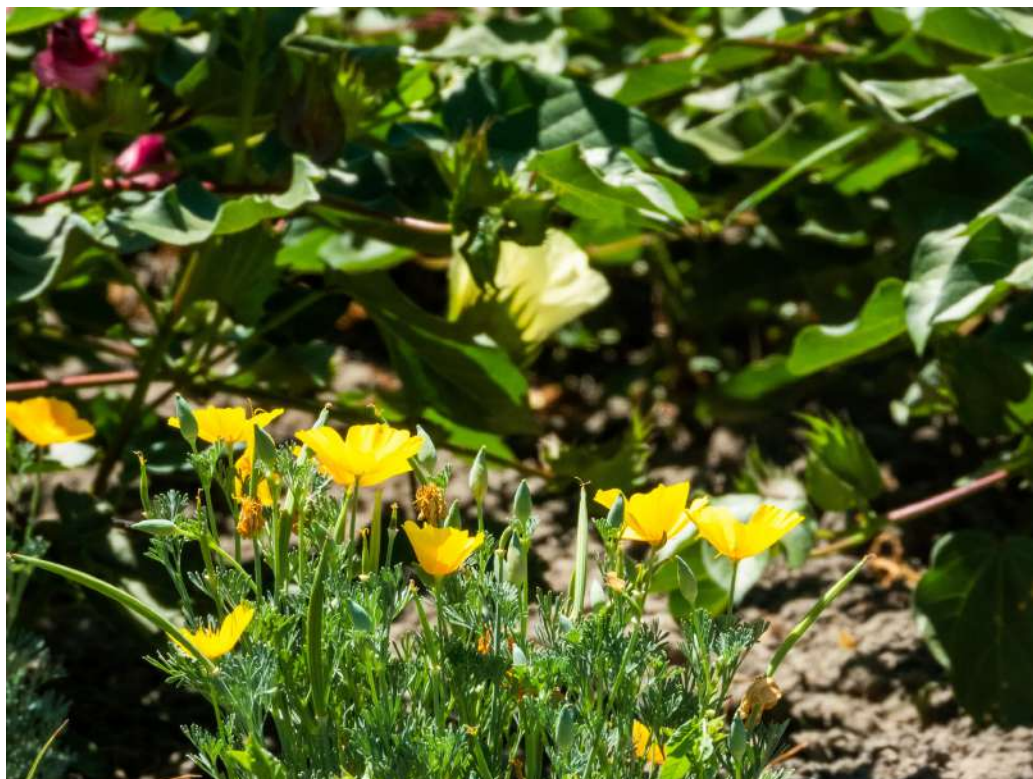

The basis of regenerative agriculture is to rationalise resources: **doing better, with less.**

This means nourishing plants properly, without impoverishing the soil but rather regenerating it, reducing emissions and the impact on biodiversity and the ecosystems.

Contrary to organic farming, which calls for the use of external inputs/additional substances (insecticides, pesticides and non-chemical fertilisers), regenerative farming does not affect the typical process of nature and ecosystems.

PAST PRACTICES

Intercropping

Intercropping is the simultaneous and close cultivation of plants of different species on the same plot of land, with the aim of promoting biodiversity and avoiding the risks of monoculture (depletion of the soil and greater exposure to diseases and parasitic attacks) . Intercropping also make it possible to enhance the complex interactions existing between plants.

Ex: Intercropping can be plants that attract insects that drive away other insects, which usually attack the plant being grown.

PAST PRACTICES

Intercropping

FUN FACT – Bowles Farming

Using this practice, a native plant known as “*Evening Primrose*” was planted near the Bowles Farming cotton field which attracted bees, as they had abandoned the farm some time ago.

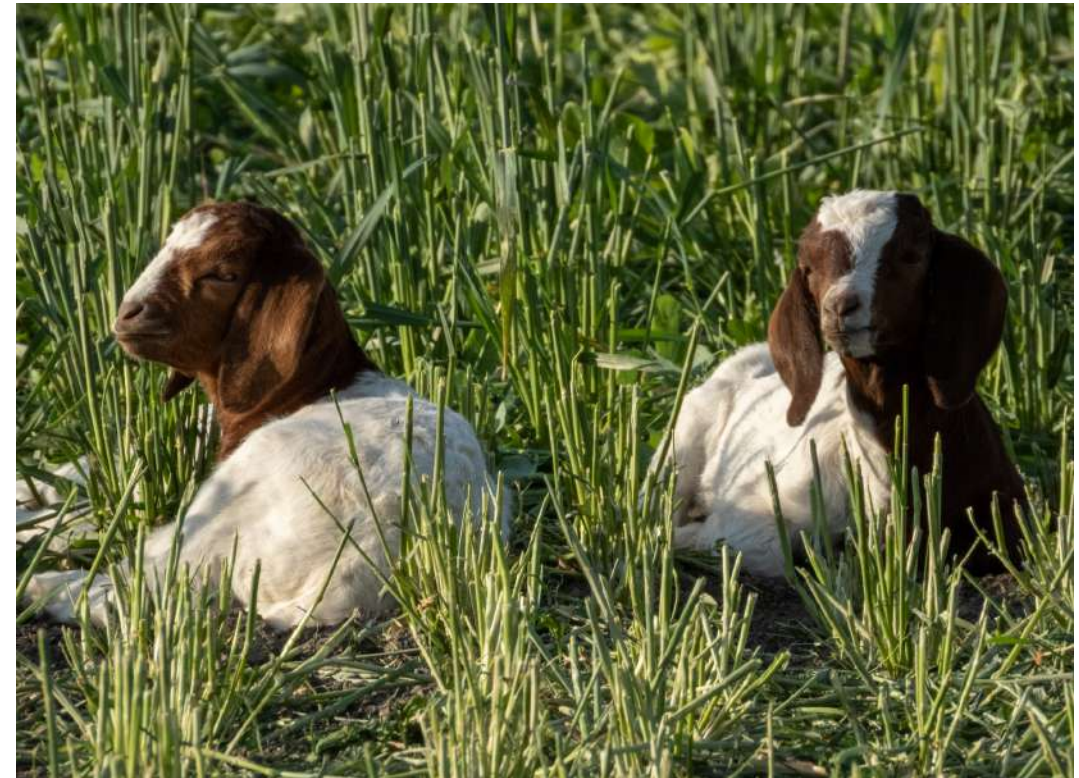

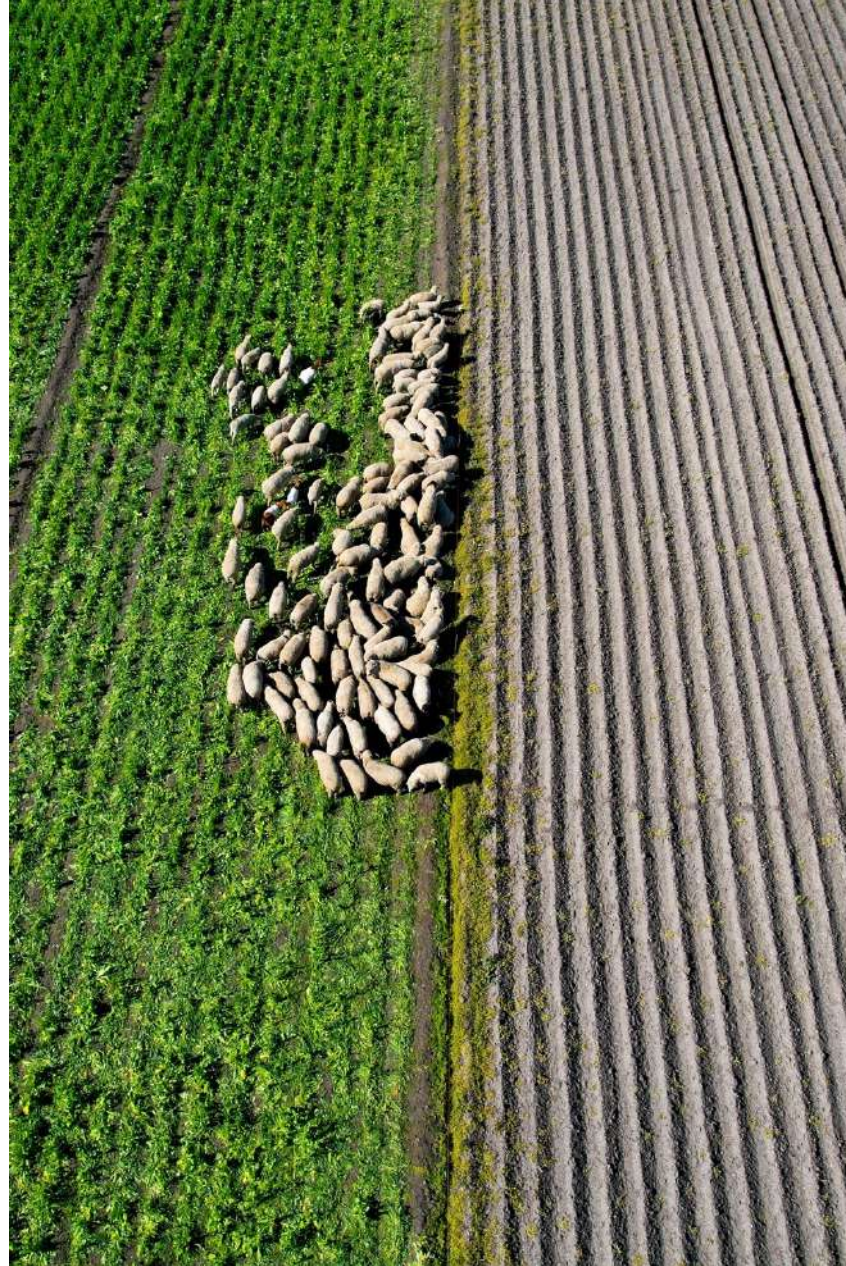

PAST PRACTICES

Integration of multi-species grazing.

This agricultural technique calls for the introduction of animals onto the agricultural terrain, in order to not use machinery to till the soil, but do it naturally and on a more superficial level.

What's more, multi-species grazing improves land fertility, weed control and the spread of pests.

MODERN SCIENTIFIC KNOW-HOW

Satellite images

The use of satellite images and drones for remote sensing of crop health, through the processing of indices such as vigour, water stress, chlorophyll level.

Forecasting models

Forecasting models that are able to optimise the use of inputs - such as water - after processing environmental data, and which enable targeted interventions to be implemented.

ORGANIC VS. REGENERATIVE AGRICULTURE

	Conventional	Biofusion®	Regenerative Biofusion®
GMO-free seed		✓	✓
Use of natural fertilisers and insecticides		✓	✓
Natural defoliation		✓	✓
Reduced tilling of soil			✓
Soil covering			✓
Waste reduction and re-use of resources			✓
Intercropping			✓
Integration of multi-species grazing			✓

**REGENAGRI
CERTIFICATION**

REGENAGRI CERTIFICATION

Regenagri certification will be applied to measure the positive impact of regenerative cultivation practices on the environment and the continuous improvement.

The **Regenagri Content Standard** and relative documents will be applied to the **supply chain** (from the first processor to the last BTB transaction) to check that a product contains the exact quantity of regeneratively cultivated cotton.

Regenagri certification, checked by the **Control Union**, adopts the same chain of custody requirements as the **Content Claim Standard (CCS)**.

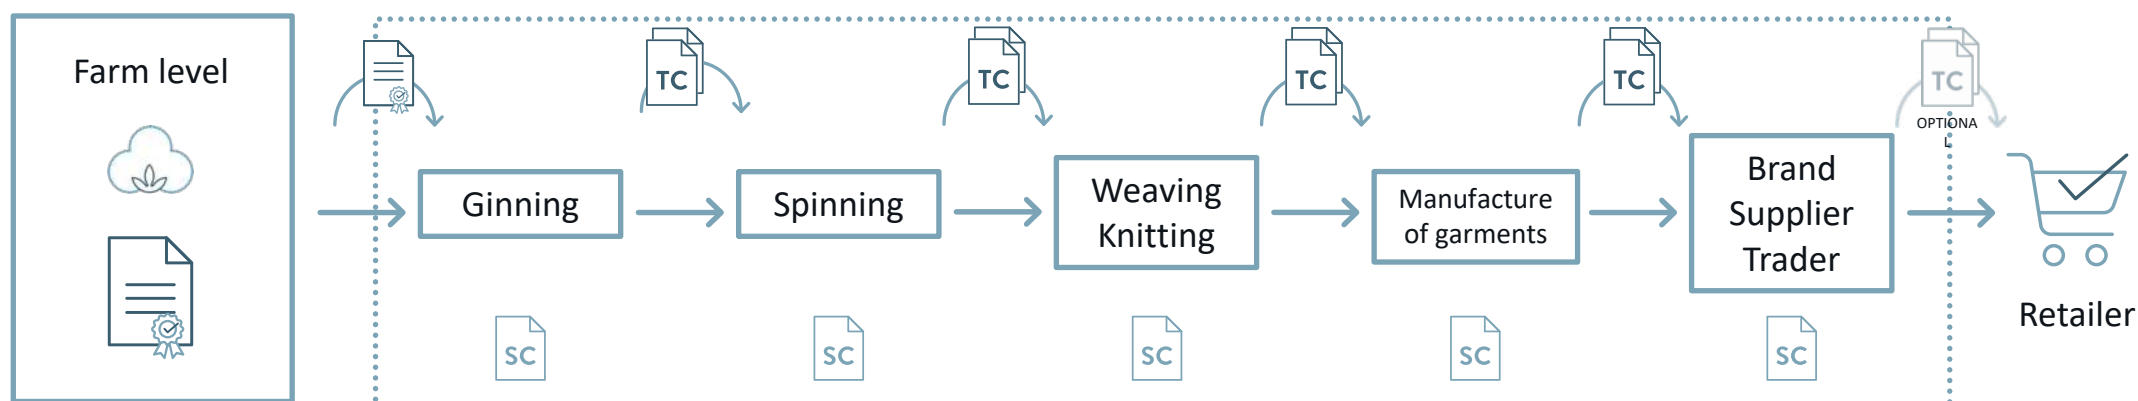

Products certified by Regenagri bear the Regenagri certification **logo**.

REGENAGRI CERTIFICATION

**Certified by
«Regenagri Standard
Criteria»**

Certified by «Regenagri Content standard»

Regenagri cotton
Control Union cert. 1234

Scope Certificate (SC) = Company
Transaction Certificate (TC) = Goods

THE ALBINI STRATEGY

AVAILABILITY

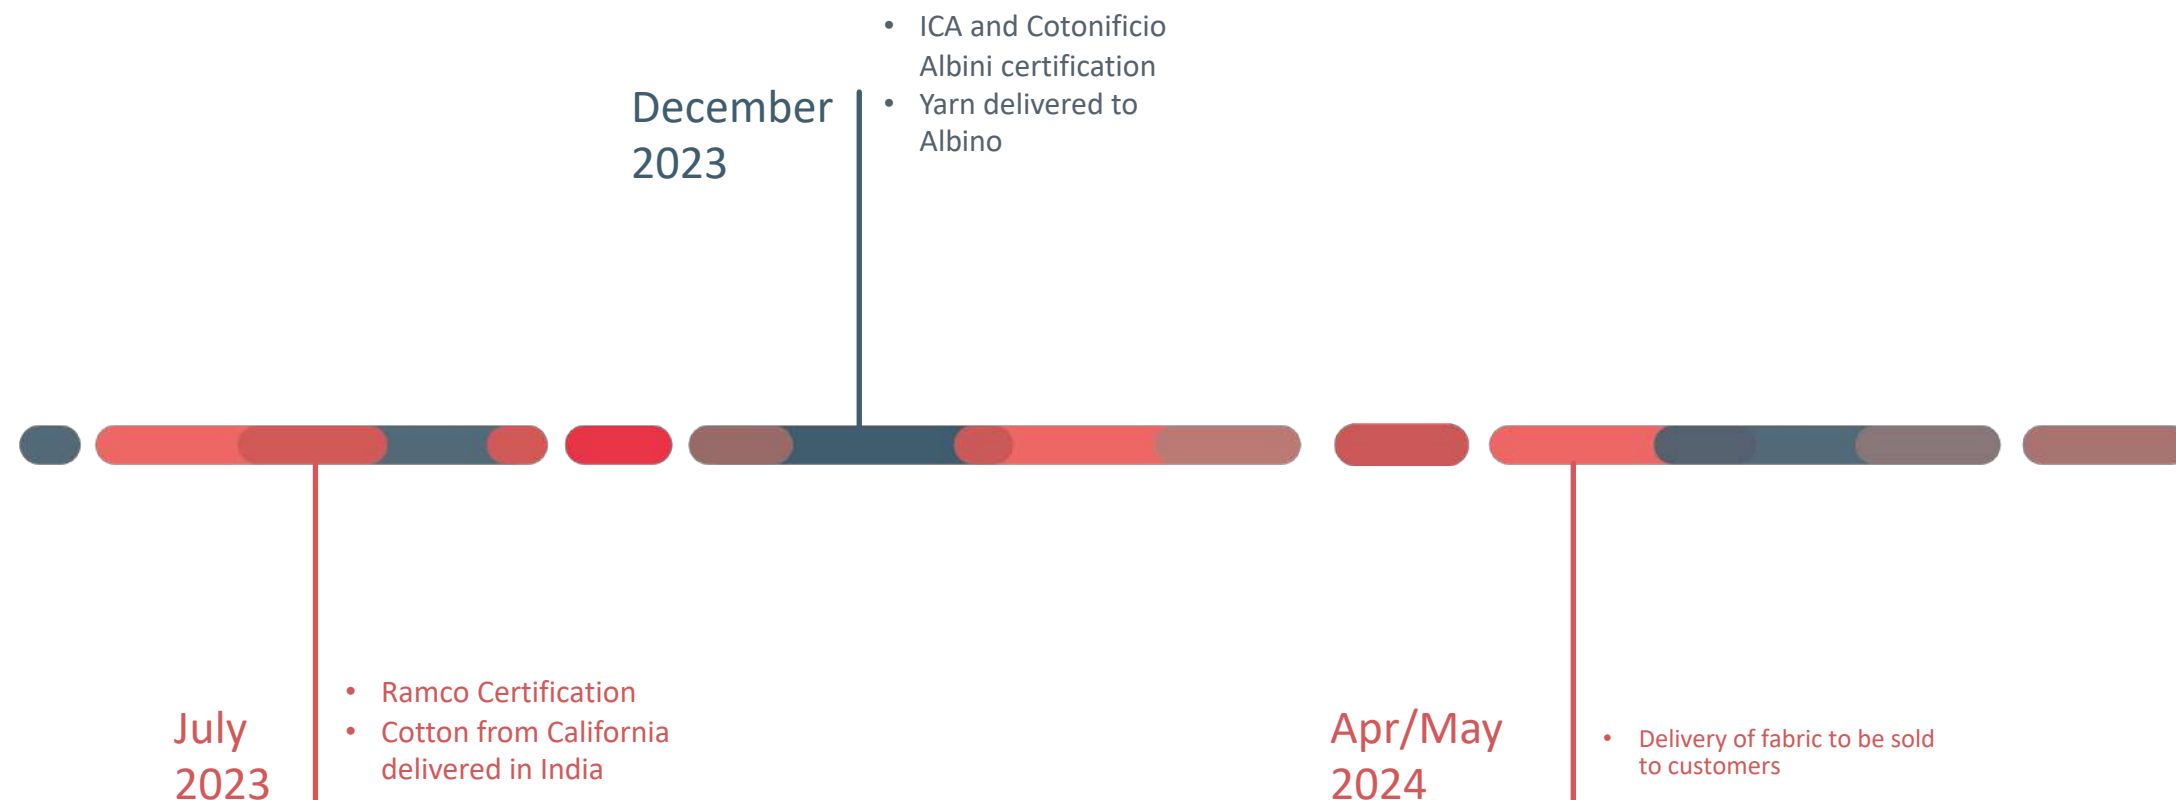

Regenerative Biofusion®

SUPPLY CHAIN

TIMELINE

YARNS COUNTS AVAILABLE

Ne 70/1 Biofusion® Supima

Ne 120/2 Biofusion® Supima

Ne 80/2 Biofusion® Supima

Ne 100/2 Biofusion® Supima

Ne 60/2 Biofusion® Supima

They will be produced on request with twists that allow the yarn to be used in both weaving and in jersey.
